

Students Trying Hard To Succeed

What we see from this graph is that less than half of the grade 8 males are not trying/caring. Grade 4 and 5 females on the other hand want to succeed the most out of the school. Another thing we see is that there are not enough grade 3's, grade 4 females, grade 5 females and grade 7 females to record on the graph so that could have affected our school average. Another thing that could have affected the results was the questions asked. The reason we say this is because the questions seemed bias because they never touched on any subject first hand except mathematics and language. This could be the reason why 8% more of girls in this school try harder than boys and theres less girls. Maybe more girls care about Math and Language while more boys care about Science and Geography. These were some of the interesting things we found on students trying hard to succeed in school.

Students Who Are Interested and Motivated

What we have seen in this graph of kids who are motivated/interested in this school is that there are very few kids motivated/interested in this school. On average, only 45% of kids in this are motivated/interested. This means that from the kids perspective, the

teachers are not giving their children to enjoy school. Although the low amount of students motivated/interested, most girls were motivated/interested. This was not surprising because more girls try harder than guys so most girls should be motivated to try hard. Even though most girls were interested/motivated, still more than half of our school was not. From this I think there are much more boys than girls. These were some of the interesting things we found from the kids who were motivated/interested in our school.

Students That Value School Outcomes

_____ What we have seen from this graph is that most of the school values their school outcomes. The grade 8 and grade 6 classes, are the two main grades that are not concerned about school outcomes, whereas 100% of all the grade 5's and 4's care about school outcomes. The mean of the entire school that believes in school outcomes

is 86%. This does not include grade 2, 3, 4 girls, grade 5 guys, and grade 7 girls. These are some of the interesting things we found from the kids that value school outcomes.
